

## Jailbreaking your iPhone to use iPhoneModem

Guide from <http://www.iphonemodem.com> - 2008/Nov/24 (updated for iPhoneOS 2.2)

### Intro

Jailbreaking is a procedure which allows you to install and run software made for the iPhone but not endorsed by Apple Inc.

There are a large number of iPhone users that want to be able to use the iPhone's Internet connection on their Mac/PC and jailbreaking is still a necessary step to do that.

It's actually quite simple thanks to the great effort of the "[iphone-dev team](#)".

The following steps on DevTeam's Quickpwn usage are similar for MacOS and Windows.

### QuickPwn

QuickPwn is an application you can download for MacOS or Windows which will install software on the iPhone enabling the use of non-Apple applications.

1. Use iTunes 8 to make sure you have the latest version of iPhoneOS - currently 2.2

2. Download QuickPwn - use one of the links

a. MacOS ~ 24.8 MB

[http://jmcoon.net/QuickPwn\\_2.2.dmg](http://jmcoon.net/QuickPwn_2.2.dmg)

[ftp://dev-team.kicks-ass.org/Quickpwn/OSX/QuickPwn\\_2.2.dmg](ftp://dev-team.kicks-ass.org/Quickpwn/OSX/QuickPwn_2.2.dmg)

b. Windows ~16.2 MB

3. Extract the software to your desktop.

4. Open QuickPwn and connect your iPhone (iTunes might show up - ignore it and use QuickPwn)

5. QuickPwn will ask a few simple questions; just move on until you see the "Turn Off connected device" message. This is a somewhat tricky part. After turning off, you must:

a. click and hold the "Home" and "Power" buttons for 10 seconds

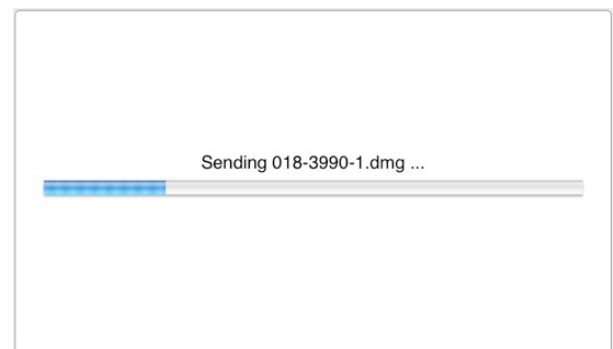

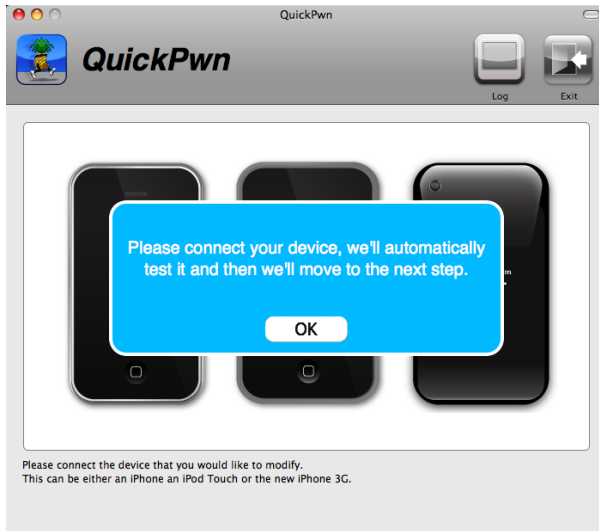

b. release just the "Power" button, keeping the "Home" pressed for another 10 seconds

c. during this last step, QuickPwn will detect iPhone's "DFU mode" and start installing; you can release the "Home" button now.

6. Finally, your iPhone will restart and you'll have a new application named "Cydia".

7. Open up Cydia, let it update all packages and install new versions; then, on the Networking Section you'll find **iPhoneModem by Addition**.
